Abstract—This paper describes the benefits of an AI image-based diagnosis system. Combining quantitative data with qualitative case studies, the study aims to assess the benefits of an AI image-based diagnosis system. These diagnosis systems are helpful for the field of healthcare and align with global initiatives like SDG Goal 3 (Good Health and Well-being) and SDG Goal 9 (Industry, Innovation, and Infrastructure), supporting the Kingdom's goals for transforming healthcare by integrating advanced technologies to improve efficiency, accessibility, and quality of medical services. By analyzing recent advancements and proposing strategic recommendations, this paper contributes significantly to the discourse on enhancing AI image-based diagnosis systems in urban environments, reflecting the latest trends and technologies in computing and information technology.

Keywords—artificial intelligence, AI image-based, diagnosis systems, healthcare, benefits

I. INTRODUCTION

The healthcare sector is not an exception to the current era of rapid expansion in artificial intelligence (AI) [1]. AI will be extremely beneficial in healthcare and will fundamentally alter how many, if not most, diseases are diagnosed and treated. The overall goal of these healthcare technologies, regardless of the particular method, is to use computer algorithms to extract pertinent information from data and support clinical decision-making [1]. AI image-based diagnosis systems are advanced technologies that use artificial intelligence, particularly deep learning algorithms, to analyze medical images for disease detection, classification, and prediction. These systems process complex image data to extract relevant patterns, assist in clinical decision-making, and provide accurate diagnostic insights, often at a level comparable to or exceeding human expertise [2].

According to [3] a robust framework is necessary for the safe, dependable, and moral application of AI systems in healthcare practice. Establishing legal and regulatory requirements for testing, certifying, and registering AI systems before deployment is the first step in this process, with risk classifications dictating the degree of scrutiny. It is essential to use a multi-stage validation procedure that includes performance validation to gauge efficacy, functional validation to make sure outputs fulfill intended purposes, and analytical validation to verify data accuracy. Measures like dual-circuit functionality to keep things running in the event of an AI

failure must be implemented in addition to ethical values like transparency, safety, and user control. To guarantee consistent outcomes, standards for datasets and system parameters are required, in addition to change management procedures for adaptive AI. Furthermore, to use AI responsibly and prevent an over-reliance on it, medical practitioners must receive the appropriate training. Moreover, medical professionals need proper training to use AI responsibly, avoiding over-reliance on algorithmic decisions, supported by specialized courses. Finally, accountability must be shared among developers, healthcare institutions, and clinicians, ensuring AI supports clinical workflows while preserving the central role of human expertise [4]. An outline of the steps is shown in Fig. 1

Fig. 1. Key Steps for Safe and Ethical Integration of AI in the Field of Healthcare.

The present study addresses the benefits of AI image-based diagnosis systems in healthcare. The research question of this paper is: What Are the Benefits of Using AI Image-Based Diagnosis Systems in the Healthcare Field? The goal is to

analyze the advantages of AI image-based diagnosis systems in healthcare. The primary objective is first to explore the relevant literature review, analyze the benefits of using AI image-based diagnosis systems in the healthcare field, including gaps, and then suggest some recommendations based on the findings. Analyzing the advantages of using AI image-based diagnosis systems in the healthcare field aligns with Saudi Vision 2030, supporting the Kingdom's goals for smart, sustainable cities through digital transformation. The significance of this study also relies on its importance to society in general. The study is related to SDG #3, "Good Health and Well-Being," which supports Target 3.8, promoting universal health coverage and access to high-quality healthcare. As AI enhances the healthcare system's ability to handle new health threats, it also helps achieve Target 3.d, which aims to strengthen health systems, and Target 3.4, which focuses on lowering premature mortality from non-communicable diseases through early detection. Furthermore, our study supports Target 9.5, which promotes the development of scientific research and technological capabilities, and Target 9.c, which emphasizes expanding access to information and communication technology to improve health IT infrastructure, under SDG #9, "Industry, Innovation, and Infrastructure." [5].

The paper is structured as follows: Section 2 provides a comprehensive literature review of the benefits of AI image-based diagnosis systems in healthcare. Section 3 explains the methodology used in this study. Section 4 presents the findings of our study and discusses these findings within the context of AI image-based diagnosis systems in healthcare. Finally, Section 5 presents a conclusion and recommendations for future work.

II. LITERATURE REVIEW

The search strategy for the literature review of the study is articulated as follows: the review begins with an introductory context setting, which outlines the objectives and defines the scope. The methodology for identifying relevant literature involves searching through databases such as Google Scholar, lens.org, PubMed, and others. Search terms are combined strategically and employed with specific inclusion and exclusion criteria to refine the search results, particularly focusing on articles published within the last 10 years only. This process is followed by a synthesis of the existing literature and a critical evaluation of the solutions, approaches, or theories discovered, and assessing their effectiveness. Finally, the review concludes with the identification of gaps in existing knowledge, pinpointing any inconsistencies or areas for further research within the existing body of knowledge on the topic.

In a recent search we conducted on November 9th, 2024, using the Lens database (<https://www.lens.org/>) and the query "Artificial AND Intelligence AND image-based AND diagnosis AND system AND healthcare," we found 5271 scholarly works related to the current topic; however, this number was reduced to 2756 when including "benefits," indicating a need to focus on the benefits of these systems. Fig. 3, displaying the distribution of papers in the last ten years, shows a

clear upward trend, indicating growing academic interest and research activity in the area of the benefits of AI image-based diagnosis systems in the field of healthcare.

Fig. 2. Distribution of Papers Explaining the Benefits of AI Image-Based Diagnosis Systems in the Field of Healthcare

Over the last couple of years, AI has been deployed across medical imagery; hence, many AI models have been developed for diagnosing different diseases. Integration of AI into any imaging device may come out with very effective diagnostic tools. Smart healthcare uses advanced machine learning and deep learning algorithms to analyze medical images like MRI, X-rays, and CT scans in image-based AI. These AI systems are developing greater diagnostic accuracy, automating image interpretation, detecting diseases early, and facilitating personalized treatment plans [15].

The review by the authors in this paper [6] on applications of AI in CAD systems reflects upon the transformative potential of AI applications in medical imaging. The review featured how AI methodologies, particularly machine learning (ML) and deep learning (DL) approaches, have significantly enhanced diagnostic accuracy, automation, and efficiency in diagnostic applications. CAD systems, using such algorithms as CNNs and ViTs, have been performing tasks related to segmentation, classification, and detection with high accuracy. All this is backed by the ready availability of large, heterogeneous datasets—for instance, ISIC for skin lesions and HAM10000 for dermoscopy—to deal with complex imaging challenges that cut across different modalities like MRI, CT scans, or X-rays. The recent development advantages can also be listed as less diagnostic workloads, higher disease detection rates, and the ability to effectively work in resource-constrained environments, thus making AI-driven CAD systems necessary in modern healthcare settings [16].

In a study by Jie Xu et al. [1] the application of artificial intelligence (AI), specifically deep learning, in medical image analysis for clinical diagnoses was explored. By offering methods for picture categorization, segmentation, and prediction, deep learning has transformed disease diagnosis, as the paper demonstrates. With an emphasis on conditions including age-related macular degeneration (AMD), glaucoma, and diabetic retinopathy (DR), it examines the advancement and use of

TABLE I
GAPS IN AI IMAGE-BASED DIAGNOSIS SYSTEMS IN HEALTHCARE AND FUTURE RESEARCH NEEDS

Identified Gap	Description	Future Research Needs	Ref
Lack of Explainability	AI models function as "black boxes," making decision-making processes difficult to interpret.	Develop interpretable AI models that provide clear, understandable explanations for their decisions.	[1], [6], [7]
Absence of Standardized Protocols	Inconsistent data acquisition, annotation, and preprocessing across institutions.	Create universal standards for data collection, preprocessing, and annotation to enhance model reliability.	[6], [8]
Data Privacy and Security	Smart healthcare systems face challenges in protecting sensitive patient information from cyber threats and unauthorized access.	Research advanced encryption techniques and federated learning approaches to enhance data privacy.	[9]–[11]
Interoperability	Diverse healthcare systems and IoMT devices lack standardized protocols, making seamless data exchange difficult.	Design frameworks to establish communication standards for IoMT devices and healthcare systems.	[9], [12]
Development of Interdisciplinary Strategies	Algorithms should help the entire diagnostic process, not just the detection of a specific disease.	Explore AI models that integrate multiple diagnostic steps, ensuring a holistic approach.	[1], [3], [13]
Challenges with Rare Diseases	The scarcity of data for rare conditions makes training models challenging.	Investigate data augmentation techniques and synthetic data generation for rare conditions.	[1], [14]
Integration Challenges	Difficulty in seamlessly incorporating AI systems into existing clinical workflows.	Develop adaptive AI solutions that align with current clinical practices and workflows.	[2], [6], [15]

AI in ophthalmology. These solutions have many benefits in the healthcare industry, according to the paper. These systems demonstrate high accuracy and consistency, enabling the precise detection of diseases such as diabetic retinopathy (DR), glaucoma, and age-related macular degeneration (AMD). By automating image analysis, they reduce the time and cost associated with manual grading, making diagnostic services more scalable and efficient. AI also improves early disease detection, enabling prompt interventions that can avoid serious consequences such as vision loss. These systems enhance the healthcare industry by offering reliable diagnostic instruments in areas with limited resources [10].

This paper [9] examines how the integration of Cloud Computing, Artificial Intelligence (AI), Machine Learning (ML), and the Internet of Medical Things (IoMT) is revolutionizing healthcare. It focuses on how these technologies enhance healthcare efficiency, disease prediction, and remote monitoring, with a special emphasis on their application during the COVID-19 pandemic in India. The study traces the evolution from basic telemedicine systems to advanced IoMT-enabled architectures that support real-time monitoring, data sharing, and predictive analytics. The most important benefits are cost reduction, improvement in patient outcomes, and more effective management of diseases, demonstrated in cases like Aarogya Setu and CoWIN [17]. Despite these advances, there are still problems to be overcome, such as cybersecurity threats, privacy concerns, and limited accessibility in rural areas, which make further development necessary to truly unlock the full potential of smart healthcare [9].

The exploration of the advantages of AI image-based diagnosis systems in healthcare underscores the critical nature of this research area. As revealed through our comprehensive review, including the recent search yielding 5271 papers related to AI image-based diagnosis systems in healthcare, with only 2756 focusing on their benefits, there are evident gaps in

the current research landscape. These gaps are summarized in Table I, including an outline of their implications for future research, emphasizing the need for a more focused investigation into the challenges and gaps that remain in AI image-based diagnosis systems development and implementation. The table shows important areas where more research is needed about these challenges. It lists these areas and explains why they are important for future studies. This table helps us see that we need to understand and solve these gaps for optimal utilization of AI technology in healthcare settings, impacting system efficiency, accessibility, and integration.

The identified gaps, such as the lack of explainability, the need for more data for rare diseases, and the lack of standardized protocols, underscore the significant need for an in-depth examination of these areas.

III. RESEARCH METHODOLOGY

This study adopts a narrative approach to explore the benefits of AI image-based diagnosis systems in the field of healthcare. Data for this study were collected through a comprehensive literature review. To achieve this, different databases were searched systematically using Google Scholar, lens.org, PubMed, and others in combination with various search terms related to AI image-based diagnosis systems, such as Artificial Intelligence(AI), image-based, diagnosis systems, healthcare, and benefits. The inclusion and exclusion criteria were applied to refine the search results by concentrating on articles published within the last decade and peer-reviewed articles. The synthesis of existing literature as well as the critical evaluation of approaches, solutions, or theories were done to identify the benefits of the AI image-based diagnosis systems.

Through this review, we anticipate offering valuable insights into the advantages of AI image-based diagnosis systems. Despite the robustness of our approach, however, we

acknowledge some limitations, such as the availability and accessibility of literature, the currency of information, and scope and coverage. Ethical considerations were paramount throughout the study. Since the study primarily involved the analysis of existing literature, no direct involvement of human subjects was necessary, but proper citation and attribution were maintained to uphold academic integrity and respect intellectual property rights.

IV. RESULT AND DISCUSSION

We aimed to assess the benefits of an AI image-based diagnosis system in the field of healthcare. We reviewed and analyzed different types of papers with different objectives to reach our aim. This section of results and discussion will present the main results we found based on reviewing different types of articles from Google Scholar, lens.org, PubMed, and others. Figure 2 presents a detailed visualization of the published work on the benefits of an AI image-based diagnosis system in the field of healthcare, using the VOSviewer tool with the query: "Artificial AND (Intelligence AND (Image-Based AND (Diagnosis AND (System AND (Healthcare))))". The key themes are "artificial intelligence," "machine learning," and "ensemble learning." The connections between these concepts suggest interrelated areas of study and highlight the complexity of the AI image-based diagnosis systems, particularly in the context of the healthcare field. The visual representation underscores the interest in the AI image-based diagnosis system, involving diverse technologies and fields where these systems are applied.

Fig. 3. Keyword co-occurrence visualization based on lens.org.

Table 4 shows a list of the significant benefits of AI image-based diagnostic systems in the field of healthcare, including improved diagnostic accuracy, early disease detection, automation, resource optimization, and better patient outcomes.

The findings ensure that AI-powered diagnostic systems are playing a transformative role in healthcare and thus prove the hypotheses of this study. The enhanced diagnostic accuracy

TABLE II
BENEFITS OF AI IMAGE-BASED DIAGNOSIS SYSTEMS IN HEALTHCARE

Benefits	Descriptions	Ref
Diagnostic Accuracy	High precision in detecting diseases from medical images.	[1], [6]
Early Detection	Enables earlier identification of diseases, improving intervention outcomes.	[1], [6]
Automation	Reduces manual diagnostic tasks and speeds up the process.	[6]
Resource Optimization	Efficiently manages resources in areas with limited medical infrastructure.	[9], [11]
Scalability	Scales AI capabilities for broader use in telemedicine and remote diagnostics.	[9]
Personalized Treatment	Supports tailored healthcare plans based on patient-specific insights.	[1], [15]
Cost Efficiency	Reduces diagnostic costs and operational overheads.	[9], [11]
Improved Outcomes	Enhances patient outcomes through precision medicine and timely intervention.	[15], [9]

and early detection present some of the most thorny challenges concerning medical diagnostics. Their current ability to identify even diabetic retinopathy at a clinician level of accuracy [1], [6] underlines their potential to improve healthcare delivery. These findings further support international efforts such as SDG #3 - Good Health and Well-being, and SDG #9-Industry, Innovation, and Infrastructure, respectively, focusing on universal health coverage and developing full-fledged technological infrastructure.

These results support previous research, which has pointed out the capability of AI to reduce diagnostic workloads and improve disease detection rates [1]. Similarly, the scalability and cost-efficiency benefits associated with the COVID-19 pandemic have been proven and identified as similar findings in the past [10].

Due to various challenges, AI in health still has many limitations. In most applications, it is difficult to have standardized protocols for data acquisition and preprocessing across implementations [7]. Scalability issues persist as the infrastructure in many parts of the world makes the inclusion of AI systems into routine flows quite problematic [10]. Ethical issues such as bias in algorithms and data privacy will need consideration in order to make AI use equitable and transparent.

Despite these challenges, the results underscore the transformative potential of AI systems in improving diagnostic practices and resource utilization in healthcare.

V. CONCLUSION

This study highlights the value of AI-powered image-based diagnostic systems in improving diagnostic accuracy, enabling early disease detection, and optimizing healthcare resources. AI has proven effective in identifying conditions like diabetic retinopathy and glaucoma early, allowing for timely interventions and better patient outcomes [1]. These findings underscore AI's potential to enhance healthcare accessibility, efficiency, and cost-effectiveness. Future research should focus on

developing standardized protocols and scalable, cost-effective solutions for diverse healthcare settings. Ethical issues like fairness in algorithms and data security must also be prioritized to ensure equity and transparency [6]. Long-term studies are necessary to evaluate the sustained impact of AI on healthcare outcomes [9].

ACKNOWLEDGMENT

The authors gratefully acknowledge the support from the College of Engineering at Effat University, Jeddah, Saudi Arabia. The authors also acknowledge the valuable discussion, suggestions, and support received from Dr Akila Sarirete the dean of Effat College of Engineering at Effat University, Jeddah, Saudi Arabia.
